

Language and archeology: some methodological problems.

1. Indo-European and Altaic landscapes

The article is the first part of a larger work that represents an attempt to systematize our ideas on the natural environment and material culture of the Proto-Indo-Europeans. It is based on a more or less complete selection of reconstructed words from the appropriate semantic areas and on their comparison with a similar selection performed for a proto-language of similar time depth, whose speakers evidently inhabited a territory that was not in contact with the Proto-Indo-European one — Proto-Altaic. In this part, only the words that belong to the semantic field of landscape terms are analyzed. The main conclusion is that the hypothesis of a steppe environment is more applicable for the Proto-Altaic population, whereas for Proto-Indo-Europeans a mountainous region seems more appropriate. As for the water bodies, for Proto-Indo-Europeans we should suppose the existence of a sea (or of a very big lake), and for speakers of Proto-Altaic, the existence of very big rivers with seasonal floods.

Keywords: Indo-European homeland, Altaic homeland, *Wörter und Sachen*, semantic reconstruction, proto-lexicon.

In order to reconstruct the phylogenetic tree of a language family, it is essential to understand what the human language is in general, and how the individual languages could be classified as nodes on one phylogenetic tree. Language may be considered a semiotic system that consists of signs and relations between signs, and serves to transmit information within a community; it is independent of individual speakers, and it has the property of changing over time. As a rule, the language sign is a two-sided entity that includes both “semantics” and “text”. The link between the semantic side and the textual side is arbitrary, conditioned by the tradition of each individual language. Therefore, any homogeneity between the textual sides of the words (morphemes, signs) and the same meanings in two different languages (which is what linguists often observe in practice) needs an explanation. If the homogeneity involves large sets of words, random coincidence is statistically unlikely. For this reason, the basic assumption of comparative historical linguistics is that these multiple homogeneous coincidences indicate that any such pair of signs represents two different reflections of one proto-sign.

The matches between the textual sides should not be necessarily exact (literal); most often, two sets of words in two languages can be deduced from a third (hypothetical), “deep”, form of the words through the application of regular phonetic rules. These “deep” forms, coupled with their meanings, are considered as proto-signs, which allows for their historic interpretation. Namely, we believe them to have been integral constituents of a proto-language that is reflected in both of the recent languages. But if such a proto-language existed, there must also have been a certain community of speakers that used this proto-language for communication. This raises the question of what kind of people this community included, where it was located and how it functioned.

It is quite reasonable to try and find any facts from other historical disciplines that could verify the existence of such a community. However, in doing that, one should not forget about the basic meaning of the term “Proto-Indo-Europeans” — a hypothetical ethnus that used to speak the reconstructed Proto-Indo-European language, which is pretty much all that we definitively know about it. Consequently, it is the linguistic part of the information that shall get priority in our research by definition.

Since most of human history lies outside the boundaries of historical records, our only possibility of retrieving lost knowledge lies in the comparison of the results of archeological excavations with the data of our linguistic reconstruction. As far as interdisciplinary cooperation is concerned, this comparison involves two types of problems. The first one is that the correlation between any particular archeological culture and any particular protolanguage cannot be established directly: there is no reason to think that the area occupied by this culture was inhabited at the time by speakers of only one language. Consequently, talking about, e.g., an “Indo-European archeological culture”, generally makes little sense. The other part, of a more subjective and technical nature, is that, unfortunately, interaction between these two disciplines is often belated, so that the archeologists build their models on fifty-year-old linguistic data, and vice versa.

However, in some cases we can state that the presumable speakers of a particular protolanguage could (or could not) be the subjects of a particular culture or inhabit a particular area. This can be established by analyzing the reconstructed lexical corpus, with a simple assumption: we expect that if a word that defines, e.g., a ‘plough’, is reconstructible for a protolanguage, then the speakers of this language could talk about ploughs and, therefore, possess them.

Now the reconstruction of the proto-lexicon involves not only the reconstruction of the phonetic shape of the word or stem, but also the reconstruction of the word’s meaning(s). When reconstructing the phonological aspects of the lexical entities, we have strict criteria that help us distinguish between genetically conditioned and typologically conditioned features. In the case of semantic reconstruction, these criteria are far more obscure. In general, linguists are guided by vague ideas of semantic similarity; at best, they rely on typologically similar cases of semantic change that are historically attested for different languages. Thus, the reconstruction of the so-called “world picture” for any proto-ethnos often places the researcher on shaky ground. It is clear that such work (traditionally defined as studies in *Wörter und Sachen*) should be more productive if the material were to be organized typologically. But any such typology should be founded on compatible data sets. If we produce a “proto-cultural reconstruction” for, e.g., Indo-European, it does not become more convincing by features that reveal any similarity with the “world picture” of “archaic peoples”, regardless of whether we are talking of, e.g., the Bushmen (San), the aboriginal Australians, or “of the Shoshonies and Blackfeet”. On the contrary — if we do not see any differentiating features, it is highly probable that what we have before us is not a reconstructed “world picture” that is specific for Proto-Indo-Europeans, but a general set of typologically natural archetypes, constructed in accordance with the personal beliefs of the researcher.

For some years already, we have been working on the reconstruction of Proto-Altaic culture, using the reconstructed Proto-Altaic vocabulary. Now that, with the publication of EDAL, we have at our disposal at least two more or less fully and reliably reconstructed proto-lexicons for two similarly dated proto-languages (6th–5th mill. BC for Proto-Altaic, 5th–4th mill. BC for Proto-Indo-European), it becomes possible to compare these proto-lexicons with particular attention to the semantic areas that are most diagnostic for the proto-homeland and proto-culture of both of these hypothetical ethnic groups.

Of the two, the problem of Indo-European proto-homeland and proto-culture has a long tradition. Today, three hypotheses on the IE proto-homeland are most popular: the Northern Black Sea steppe area (validated in the works of M. Gimbutas and endorsed, among others, by P. Friedrich, D. Q. Adams, J. P. Mallory, D. W. Anthony), the Balkans or Carpatho-Balkan area (validated by a number of Hungarian archeologists and, in Russia, by I. M. Diakonoff, V. A. Safronov), and the Anatolian area (supported by V. V. Ivanov, T. V. Gamkrelidze, C. Renfrew). Since the Proto-Altaic reconstruction is much younger, there is currently but one hypothesis on the Proto-Altaic homeland, suggested by G. Ramstedt and supported by K. H. Menges — one that is in agreement with the very name of this language family.

The basic works that are used below, as concerns the Indo-European side of the study, are Гамкрелидзе & Иванов 1984, Schrader & Nehring, Benveniste 1970, WP (and the database created by S. L. Nikolaev on the basis of this dictionary¹), Pok., Friedrich 1979, Renfrew 1987, and Adams & Mallory 1997. The main source on Altaic material is EDAL; apart from that source, we also consult some older works on Altaic linguistics, such as the series of papers by Leningrad scholars, led by V. I. Tsintsius, that analyze fragments of the Common Altaic cultural lexicon (published in such series as ОСЛАЯ, ИОЭАЯ, АЭ). Cf. also my own paper А. Дыбо 1997.

Reconstruction of semantic features in a proto-language may be formalized if we consider the variability of the meanings of individual reflexions as a kind of polysemy (analogous to polysemy within one language or one small group of closely related languages), and then work with this polysemy by comparing it with the common ways of semantic derivation that are attested in synchronic semantics.

Naturally, our definition of “proto-lexemes” will be restricted to non-derived words² or such derivatives as can be reconstructed for the proto-language and cannot be explained as having been separately derived in some daughter languages after a productive pattern³.

Reconstruction of lexical items that are relevant for the proto-culture involves a number of problems concerning the semantic description of the so-called “encyclopedically loaded” semantic fields, or “lexics of concrete lexicon”. It should be noted that, when working on the entities of an encyclopedically loaded semantic field, the semantic description that is appropriate for historical studies can be obtained if we divide the semantic features that structure the field (or a lexical microsystem within the field) into “functional” ones and “formal” (or “topo-

¹ <http://starling.rinet.ru/cgi-bin/response.cgi?root=config&morpho=0&basename=\data\ie\piet&first=1>

² The types of derived words that may, however, be included in the procedure of semantic reconstruction for substantive entities were defined in А. Дыбо 1996: 29; these include diminutives (diminutive affixes are almost always semantically “empty”, working almost exclusively as stem-building morphemes), substantivated adjectives and locative names. Such reflexions can usually be identified with primary names.

³ For this reason, we do not consider such words from Mallory & Adams 2006 as, e.g., **mldho/eh_a-* ‘clay’ (e.g., OE *molde* ‘sand, dust, soil’ [NE *mould*], Grk *málthē* ‘modelling mixture of wax and pith’, Skt *mr̥d-* ‘clay, loam’), since they are derived (by means of heterogeneous suffixes) from the verb **mel-* ‘to grind’. The second word from Mallory & Adams 2006 to denote ‘clay’ (**tkwreh_iyot-* > OIr *crē* ‘clay’, Lat *crēta* ‘chalk’, Toch A *tukri* and Toch B *kwriye*, both ‘clay’) is rather a term for pottery material, not for a type of landscape. No PIE landscape term can be seen in the connection between OE *swelle* ‘slope, rise in land’ and Toch B *ṣale* ‘mountain’, since, *contra* Mallory & Adams 2006, neither of them can be traced back to PIE **swelno-* ‘slope’. The PToch form, according to Adams 651, can be reconstructed in two ways: a) **sw̥ile* < PIE **swelo-*, probably related to Germanic **swel-* ‘to swell’, which is proposed as the formative stem for OE *swelle*, but not with the same suffix; b) **s’älwe*, from a putative PIE **selwo-* and connected with Latin *silva* ‘forest’ (with dialectal *-i-* for *-e-*). The majority of stems, considered below, can be reconstructed as noun stems (often as root nouns) for PIE, and their suffixal extensions in different languages can be interpreted as adjectival or diminutive ones.

graphic") ones. The words whose meaning contains "functional" elements are the basic points of the semantic structure of the field, while their "topographic" capacity and types of regular polysemy define the direction of semantic shifts undergone by other words of the field.

As an example, among the different names for 'dwelling' one often finds two types of names for 'house'. Those with a functional value mean not only 'a certain type of building', but also 'locus of the subject'. These words show a regular polysemy: 'house' — 'the house-dwellers' — 'the family living in the house'. It is clear that such words are basic for the field, generally more frequent and better revealing the tendencies of semantic evolution within their particular semantic field (such as English *house*, Russian *дом*). Other words (such as English *cottage*, Russian *хижина*) serve to denote only specific types of buildings and do not have such polysemy. The main problem in reconstructing the semantics of the "encyclopedically loaded" words is to reconstruct the "topographic" features, since the functional features are generally preserved or can be traced in the evolution of the lexical field, while the "topographic" ones may be simply replaced along with changes in the surrounding environment, so that, in order to trace them, we have to use indirect evidence (e.g., one can suggest the presence of a rectangular type of dwelling if the language had a regular polysemy between 'inner angle' and 'a part of the dwelling').

Another point is that it is important not only to choose the "diagnostic" proto-words that are the most relevant ones for the problems involved, but to consider the full scope of available etymological evidence in all thematic fields, which permits us to compose a complete picture of the lifestyle shared by the speakers of the proto-language.

Below I list an example of a group of "proto-words", prepared for the procedure of semantic reconstruction. This is the comparison of two fragments of Proto-Indo-European and Proto-Altaic systems of landscape terms.⁴

If we interpret the variability of the meanings as polysemy within a language family, certain definite differences between Altaic and Indo-European may be observed. Thus, it appears that the type of polysemy that is quite familiar for us (“earth as place” — “earth as soil”) is characteristic of Indo-European languages, but significantly less so for the Altaic languages, where the meaning “earth as soil” is often connected with such meanings as “bad soil”, “marsh”, “sand”, “salt marsh”. On the other hand, the Altaic languages have another series of words meaning “sand”, related to the meanings “pebbles” and “shallow place”, and this word group has an exact semantic analog in the Indo-European languages. While there is only one name for “stone” in the Altaic languages, we find many names for different types of stones in Indo-European (which brings to mind the well-known story about the lack of a general name for “snow” in Eskimo and the diversity of specific names for different types of snow). Almost obligatorily figuring among the meanings related to the sense of “flat place, plain” in various Altaic groups is the meaning “hill, mound, mountain” — something that would be quite atypical of Indo-European languages. Common words meaning “meadow” as a clearing inside a wood exist in PIE but are absent in PA. This means that the ideas of the corresponding landscape objects must have been significantly different for speakers of Proto-Altaic and Proto-Indo-European.

Let us now try to demonstrate, as completely as possible, the sets of landscape terms that are reconstructible for PIE and for PA.

Mountainous terrain

Indo-European	Altaic
<p>Mountains</p> <p>PIr *g̡əri-, Ind. <i>girī-</i> m. ‘mountain’, PIran. *gari- ‘Berg’, Grk. δειράς, -άδος, kret. δηράς f. ‘Anhöhe, Bergrücken’ (Hes.), δειρά ‘mountain range’ (Pind.) Based on these juxtapositions for a number of proto-lexical microsystems, the following conclusions can be proposed.

The peculiarities of the landscape-related lexicon in both families are as follows. First of all, the steppe must be excluded from the regions potentially inhabited by Proto-Indo-Europeans.¹¹ Some relatively high mountains with many kinds of rocks and sharp or big stones are present.¹² Some of these mountains are covered by forests. There are words for narrow passages, canyons, precipices, mines and caves, foothills, valleys and dells, meadows in

¹¹ When I say — more or less arbitrarily — about the “Proto-Altaics” and “Proto-Indo-Europeans”, each of these labels surmises a big human community whose members are territorially and culturally related: hypothetic ethnos-speakers of the Proto-Indo-European language, reconstructed for the initial period of its disintegration into separate groups of languages, and, likewise, hypothetic ethnos-speakers of the Proto-Altaic language, reconstructed for the same period. The contrastive list of Proto-Indo-European and Proto-Altaic thesauri in selected thematic areas is still preliminary; conclusive results will be obtained upon systematic application of semantic reconstruction to all the subgroups of related languages.

¹² Cf. the identical conclusion, reached on different grounds by Гамкрелидзе & Иванов 1984.

forests and on the river-banks. The rivers have fords and are definitely smaller than their Proto-Altaic counterparts (there is no semantic variation between “river” and “sea”; nota bene that the only trace of the name of flood is GA; the lower Danube?); cf. here the noticeably weaker function of fish in the Indo-European economy (expressed in a substantially smaller number of terms for fishing tools, fish body parts and fish species — see the example below). But they could have lived near a sea or a big lake with sandy banks¹³.

In Proto-Altaic, the landscape was represented by names of not very high mountains, low-pitched slopes, foot-hills (also with rocks and gravel). They had a number of verbs meaning “to cross mountains.” The canyons, valleys and steppes are present, the steppes being of a rather arid and dusty type. There are many terms for small, quick-flowing rivers with shallows and rifts, but we also know words for big rivers as well. The reflexes of those words reveal semantic variation: in some daughter languages they mean “big river”, while in the others the meaning is “sea”. We may talk about islands and floods. Floods, from my point of view, may rather indicate big rivers with seasonal floods. We still do not have a reliable reconstruction with the undisputable meaning of “sea”. The Tungus-Manchu name for sea can be traced back to a common name for wave, while the common Korean and Japanese forms originally meant “ford”. The same development is found, for example, in Ancient Greek, where the corresponding word is historically explained as a development of the original meaning “aquatic way”.

Fishing tools

Indo-European	Altaic

? PIE (GA) *pork- ‘fish-net, noose’: Arm. <i>ors</i> ‘hunt, catch’ Martirosian 544 (to *york-os ‘roe’); Grk. πόκος m. ‘Art Fischernetz’ Beekes 1222. WP II 44 # Cf. PA *p'ürVk'V ‘rope, lasso’.	PA (West) *nabile ‘net, fish-trap’: PT *jilim ‘fishing net’; PTung *nalba ‘fish-trap, crib’.
PIE (Eur.) *wadh- ‘fish net’: Slav. *vodv; *nevodv ‘dragnet’ Фасм. 3, 55–56; Balt. *wad-a-, -u- . ‘grosses Zugnetz; Flügel eines Zugnetzes’ Fraenkel 1177; Germ.	PA (West) *iunji ‘to weave (nets), net’: PNM *(h)öye-si ‘fishing net’; PTung *injji- ‘to weave net’.
	PA (West) *t'ukV ‘fishing dam, fishing net’: PT *Tug ‘dam, fish-trap’; PNM *togsija ‘bird net, fish net’; PSTung *tuki- ‘to fish by a stake net in a narrow channel’.
	PA *gòlì ‘a k. of tool for water-hunting’: PM *gol-mi ‘net’; PTung *goli ‘net for big fishes’; PJa *kùrúri ‘arrow for shooting sea-birds or for catching fish’.
	PA *bé ‘bait’: PCT *be-ŋ ‘bait, bird-seed’; PTM *be ‘bait’; PJa *bái ‘bait’.
	PA *il'bí ‘fish bait’: PNM *(h)ilbeye-siün ‘fish bait’; PTM *ilbī ‘bait; plummet, sinker’; PJa *i(n)sa-r- ‘to fish’.

¹³ Cf. Гамкрелидзе & Иванов 1984: 673–674; they are definitely right that the IE names for ‘sea’ could originally be the names for some big and deep lake, but the existence of names for ‘salt basins’ derived from the IE name for ‘salt’ in a number of IE languages is not necessarily proof of the fact that Proto-Indo-Europeans must have known salt lakes or seas. Cf. the similar conclusion in MA 498.

Indo-European	Altaic
<p>*wadiz ~ wadōn ‘fishing line; dragnet’ Orel 438 WP I 255, Pok. 1, 78.</p> <p>[PIE (Eur.) *rēt- ‘sieve, net’: Balt. *rēt-ia- ‘sieve’, *ret-ūk-a- ‘thin net’ Fraenkel 724–725; Lat <i>rēte</i>, -is n. ‘Fisch-, Jagdnetz’ WP I 142, Pok. 332–333 (sub <i>era-</i> ‘rare’)].</p> <p>PIE *g(‘)ribh- ‘fischung basket’: Grk. γρῖφος, γρῖπος m. ‘fishing basket’ Beekes 287 (Pre-Greek); Germ. *kribjōn-, *krubbōn ‘crib’ Orel 222. Rather different derivatives from *nōd- ‘knot’].</p> <p>[PIE *ankos ‘hook’, see Pok. 45–46, WP I 60, MA 2, 272, rather is not specialized for PIE as fishing hook].</p>	
<p>On the whole 1 reliable PIE term for fishing net, 1 reliable Eur. term for fishing net, 1 reliable Eur. term for fishing basket, 1 reliable Eur. term for a fishing tool.</p>	<p>On the whole 2 reliable PA terms for fishing net, 2 reliable PA terms for bait, one reliable PA term for a fishing tool; 3 reliable Western Altaic terms for fish traps.</p>

We can also see that a substantial part of landscape environment terms can be reconstructed only for the later stages of PIE. The set of terms that is reconstructed for PIH is hardly telling: PIH *dg’hom/*dg’hem ‘earth, soil, territory, earth surface’; PIH *wedn-/*udn- ‘earth, soil, territory’; PIH *pē(n)s- ‘sand, pebble’; PIH *h₂ek(‘)h₂-mon, *kā-mon (< *keh₂-mon-) ‘stone, rock’; PIH *Har- ‘valley, vale, dale; grotto; swamp’; PIH *peru-(n-) ‘mountain top’; PIH *kolHn-, *kolHm- ‘top, hill, rock’; PIH *weHr-/uHr- ‘water, moisture’; PIH *we(n)dh- ‘water, wave’; PIH *Hap- ‘water, river’; PIH*gʷela- ‘to boil over’; ? PIH *woHp- ‘basin’. Nonetheless, even in this case we see mountainous terrain entering the picture.

Abbreviations

Alb — Albanian	Grk. — Ancient Greek	MIr — Middle Irish

А. В. ДЫБО. Язык и археология: некоторые методологические проблемы. 1. Праиндоевропейская и праалтайская ландшафтная терминология.

Статья представляет собой первую часть работы, в которой проводится попытка систематизировать наши представления о природном окружении и материальной культуре праиндоевропейцев на основании, во-первых, максимально полной выборки реконструированной лексики соответствующих семантических областей, во-вторых, ее сопоставления с такой же выборкой, сделанной для прайзыка сходной временной глубины, носители которого явно обитали на территории, не контактной с индоевропейской прародиной — для праалтайского. Здесь представлена лексика, связанная с ландшафтом. Основной вывод заключается в том, что из двух рассмотренных пралексиконов на степное природное окружение указывает скорее праалтайский; праиндоевропейский указывает скорее на горную местность. Что касается водных объектов, для праиндоевропейского окружения следует предполагать наличие моря (или очень большого озера), а для праалтайского — наличие очень больших рек с сезонными разливами.

Ключевые слова: индоевропейская прародина, алтайская прародина, метод слов и вещей, семантическая реконструкция.
